

## The Hoodoos of Mars

ESP\_050626\_1565

On Mars, we often see inverted river channels preserved perched above the surrounding terrain because the sediment inside the river channel was stronger than its surroundings. Here are high-standing columns protected by a strong cap rock, called “hoodoos.” Looking closer, we see what looks like a crater and its rays of ejecta, preserved and slightly higher than the surrounding terrain, possibly due to a similar process.
