## Frosty Northern Dunes

[uahirise.org/ESP\\_024265\\_2535](http://uahirise.org/ESP_024265_2535)

Dark fan-shaped deposits around the edges of the dunes are at spots where the ice has sublimated (gone directly from ice to gas) and the ice layer has ruptured, allowing the sand from the dune to escape out from under the ice.
