## **Meanders and Tributaries in Ridge Form in the Zephyria Region**

[uahirise.org/ESP\\_024484\\_1750](http://uahirise.org/ESP_024484_1750)

This observation reveals two obvious features: the smaller, narrow ridges oriented vertically are yardangs, which are created by wind erosion; and the inverted, meandering channel snaking through the image. These formations were caused by similar processes.
