

Stratigraphy in Crommelin Crater

ESP_017343_1850

HIGH RESOLUTION IMAGING
SCIENCE EXPERIMENT
UAHIRISE.ORG

Crommelin Crater in northwest Meridiani Planum is a large structure which contains light-toned material with layered and stepped buttes. Other areas in this image are covered by dust (which appears relatively blue in this representation). The layering may have been the result of sedimentation early in the history of Mars.

The HIRISE camera onboard the Mars Reconnaissance Orbiter is the most powerful one of its kind ever sent to another planet. Its high resolution allows us to see Mars like never before, and helps other missions choose a safe spot to land for future exploration. Thousands of images are available online at: uahirise.org.
