

A Large, Banded Angular Fragment in Nili Fossae

ESP_035062_1995

HIGH RESOLUTION IMAGING
SCIENCE EXPERIMENT
UAHIRISE.ORG

In a Context Camera (CTX) image, there is a large angular fragment that appears to have light and dark-toned bands. HiRISE images of similar fragments nearby also show this banding, and the resolution of our camera may help determine what these layers are. Nili Fossae was once considered a potential landing spot for the Mars Science Laboratory, and has one of the largest, most diverse exposures of clay minerals.
