

# Which Way is Up?

ESP\_035969\_1825

Which way did the lava flow? It might appear that the lava flowed from the north through the channel into the partially filled crater. However, closer examination reveals that the partially filled crater sits on top of the large crater’s ejecta blanket, making it higher than the lava flow to the north. Since lava does not flow uphill, that means the explanation isn’t so simple.
