

Global Eyes on an Impact Prize

ESP_036059_1835

A new dark spot was viewed by the Mars Color Imager (also onboard the Mars Reconnaissance Orbiter) in 2012 proved to be of interest for other science teams with instruments on the orbiter, including the Context Camera. This led to HiRISE imaging the area of interest in greater detail and higher resolution, a prime example of coordination to study a common science goal.
