

# Moving Mass Material on a Mesa

ESP\_036382\_2255

This image appears to show some type of mass movement of material down the wall of a mesa in Deuteronilus Mensae. The full image also show an arc-shaped ridge at the end of the valley. The ridge may be a moraine from a glacier. HiRISE may be able to see that the surface of the moraine is coarser than the material in front of the ridge.
