

A New Crater on a Dusty Slope

ESP_048686_1785

This image shows a new impact site originally detected by the Context Camera onboard MRO. The crater is on a dusty slope, which also has several dark slope streaks due to dust avalanches. A previous impact at another place on Mars triggered a major dust avalanche but this one did not. This tells us that the dust here is more stable (stronger and/or on a lower slope).
