

# The Eastern Slope of Asimov Crater’s Central Pit

ESP\_057522\_1330

A closeup shows new recurring slope lineae forming during the summer just after the recent global dust storm. How these features form is still under investigation. Additional changes documented here and at other locations as a result of the dust storm may provide some insight into their formation. (NASA/JPL/University of Arizona. Alt: 252 km, less than 1 km across.)
