

# Frost Highlights in the Springtime

ESP\_059681\_2410

This image of a crater rim strikingly shows what appear to be bright white flows coming from gullies in the crater wall. However, these features have been here for years, but it's the extensive frost that is getting our attention. The frost seems to have formed in the gully deposits and not so much on the surrounding rock. (NASA/JPL/University of Arizona)
