

An aerial photograph of a desert landscape on Mars, showing numerous sand dunes. The dunes are covered in a fine-grained material, likely sand or silt. The lighting creates strong shadows, highlighting the three-dimensional structure of the dunes. The north-facing slopes of the dunes are covered in a light-colored frost, contrasting with the darker, reddish-brown material of the dune crests and the surrounding plains. The overall scene is a vast, desolate, and rugged environment.

# FROSTED DUNES IN THE DEPTHS OF WINTER

*Sand dunes are moving across this landscape from top left to bottom right. Winter frost covers the colder, north-facing half of each dune.*
